

QA Rubric Weighted Scoring Summary

Every ticket review scores nine criteria on a 4-point scale: 4 = Excellent, 3 = Meets Standard, 2 = Developing, 1 = Does Not Meet. Criteria are not equally important, so each carries a weight. The weights below determine how much each criterion moves the final percentage.

Criteria weights

Criterion	Weight	Max points	Share
Tone, professionalism & acknowledgment	3	12	16.7%
Next steps & ownership	3	12	16.7%
Call/channel judgment	1	4	5.6%
Root cause identified	3	12	16.7%
Technical accuracy	3	12	16.7%
Completeness (workaround vs. fix)	2	8	11.1%
Jira bug ticket	1	4	5.6%
Internal notes	1	4	5.6%
Follow-up commitments	1	4	5.6%
Total	18	72	100%

Weight by dimension

Dimension	Weight	Max points	Share
Communication	7	28	38.9%
Technical advice	8	32	44.4%
Process adherence	3	12	16.7%
Total	18	72	100%

How the final percentage is calculated

1. Score each criterion 1-4, or mark it n/a if it does not apply to the ticket.
2. For each scored criterion, multiply the score by its weight. That is the points earned.
3. For each scored criterion, multiply 4 by its weight. That is the points available.
4. Add up the earned points, add up the available points, and divide one by the other.

$$\text{Final \%} = \text{sum of (score} \times \text{weight)} \div \text{sum of (4} \times \text{weight)}$$

Both sums include only the criteria that were actually scored. A criterion marked n/a is excluded from the earned points and the available points, so a ticket with no bug is scored out of 68 rather than 72 and is not penalised for having no Jira ticket.

Reference points

If every criterion scores the same, the weights make no difference: straight 4s give 100%, straight 3s give 75%, straight 2s give 50%, straight 1s give 25%.

Weighting only changes the result once scores differ between criteria — which is the point: it decides whether a strong technical answer with a weak sign-off scores higher or lower than the reverse.
